Objective

Computer Science undergraduate with strong OOP and Data Structures & Algorithms fundamentals (450+ LeetCode problems), seeking a Software Developer Internship. Experienced building and deploying full-stack web apps end-to-end with TypeScript, Node.js, REST APIs, and SQL/NoSQL databases, using Git-based workflows.

Projects

DevPrep — AI-Powered Developer Interview Platform

GitHub

TypeScript, Next.js (App Router), Node.js, REST APIs, Judge0, Gemini API, Groq Whisper, pnpm Monorepo

- Built an AI-powered interview practice platform end-to-end with modular, OOP-based design — integrated Judge0 to execute user-submitted code and deliver real-time pass/fail verdicts across 24+ engineering, data, design, and product roles
- Developed REST API routes in Next.js for voice transcription (Groq Whisper `whisper-large-v3`) and structured, per-response interview feedback via the Gemini API
- Wrote clean, maintainable code with clear separation of concerns; debugged and resolved production issues including state-management and error-handling bugs
- Structured as a pnpm monorepo with Next.js App Router, owning the architecture from schema design through deployment

Brainly AI — AI-Powered Second Brain

Live Demo | GitHub

TypeScript, Next.js, Node.js, PostgreSQL, Prisma ORM, JWT, REST APIs, pnpm Monorepo

- Shipped a full-stack knowledge management system live with modular backend design: content is chunked, embedded, and stored in a vector database, with semantic search retrieving relevant results at query time
- Structured the codebase as a pnpm monorepo (frontend + backend + db packages) with shared TypeScript types, JWT auth, and a typed REST API consumed by the Next.js frontend
- Designed the relational schema in PostgreSQL with Prisma ORM and self-directed deployment on Vercel and Railway
- Diagnosed and fixed a production integration failure by migrating the embedding provider to a hosted API, improving reliability

Chat App — Real-Time Messaging System

GitHub

Node.js, WebSocket (ws), TypeScript

- Built a real-time chat server on the native WebSocket protocol (no Socket.io abstraction) — implemented connection lifecycle management, room-based message routing, and graceful disconnection handling
- Added JWT-based authentication at the WebSocket handshake layer to secure connections before allowing message routing
- Deliberately worked at the protocol level to understand underlying networking and server design rather than relying on higher-level abstractions

Technical Skills

Languages: TypeScript, JavaScript, C++, Python (basic), HTML, CSS

Concepts: Object-Oriented Programming (OOP), Data Structures & Algorithms, REST API Design, Agile/Scrum basics

Frontend: React, Next.js, Tailwind CSS, Vite

Backend: Node.js, Express.js, REST APIs, WebSockets, JWT Auth, Zod

Databases: SQL, PostgreSQL, MongoDB, Prisma ORM, Vector Search

AI Integration: Gemini API, Groq Whisper, LLM prompt engineering, semantic search pipelines

Tooling: Git, GitHub, Docker, AWS, Postman, pnpm, Turborepo, Vercel, Railway, VS Code

Achievements

Hackathons: Competed in multiple college-level hackathons — ideated, built, and shipped projects under real time pressure with cross-functional teams

DSA: 450+ problems on LeetCode · 550+ across platforms (C++) — graphs, DP, trees, binary search

Education

Bachelor of Computer Applications — Karnataka University, Dharwad, India

CGPA: 8.14
